Image Filtering in Frequency Domain

Discrete Fourier Transform

- Discrete Fourier Transform

$$F(u, v) = \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) e^{-j2\pi(\frac{ux}{M} + \frac{vy}{N})}$$

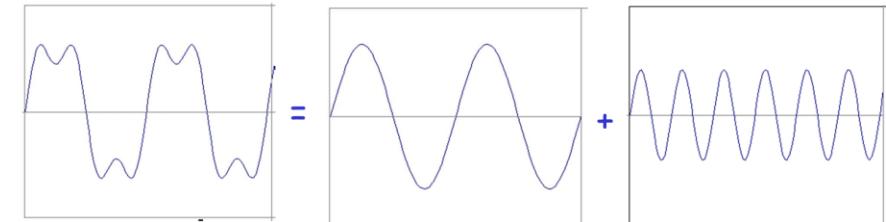

for $u = 0, 1, \dots, M - 1$ and $v = 0, 1, \dots, N - 1$

- The inverse DFT can be written as

$$f(x, y) = \frac{1}{MN} \sum_{u=0}^{M-1} \sum_{v=0}^{N-1} F(u, v) e^{j2\pi(\frac{ux}{M} + \frac{vy}{N})}$$

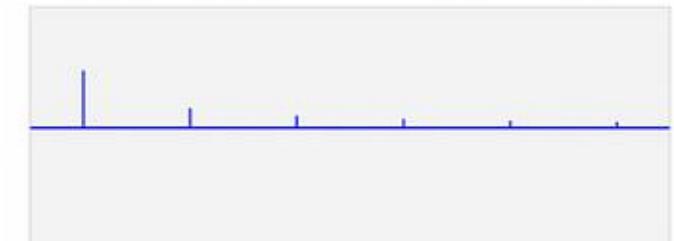

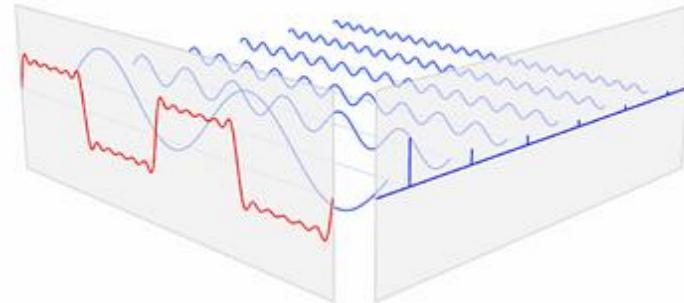

for $x = 0, 1, \dots, M - 1$ and $y = 0, 1, \dots, N - 1$

Note: $e^{j\theta} = \cos \theta + j \sin \theta$

$$f(x) = \sin x + \frac{1}{3} \sin 3x + \dots$$

$$f(x) = \sum_{n=1,3,5,\dots} \frac{1}{n} \sin nx$$

Discrete Fourier Transform

$$\begin{aligned} F(u, v) &= \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) e^{-j2\pi\left(\frac{ux}{M} + \frac{vy}{N}\right)} \\ &= \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x, y) \left[\cos\left(2\pi\left(\frac{ux}{M} + \frac{vy}{N}\right)\right) - j \sin\left(2\pi\left(\frac{ux}{M} + \frac{vy}{N}\right)\right) \right] \end{aligned}$$

for $u = 0, 1, \dots, M - 1$ and $v = 0, 1, \dots, N - 1$

DFT in polar form:

$$F(u, v) = |F(u, v)| e^{-j\phi(u, v)}$$

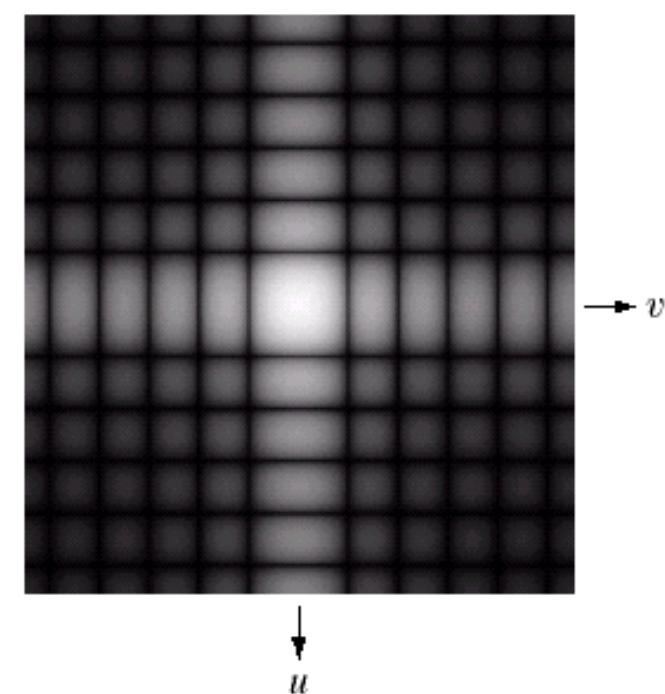

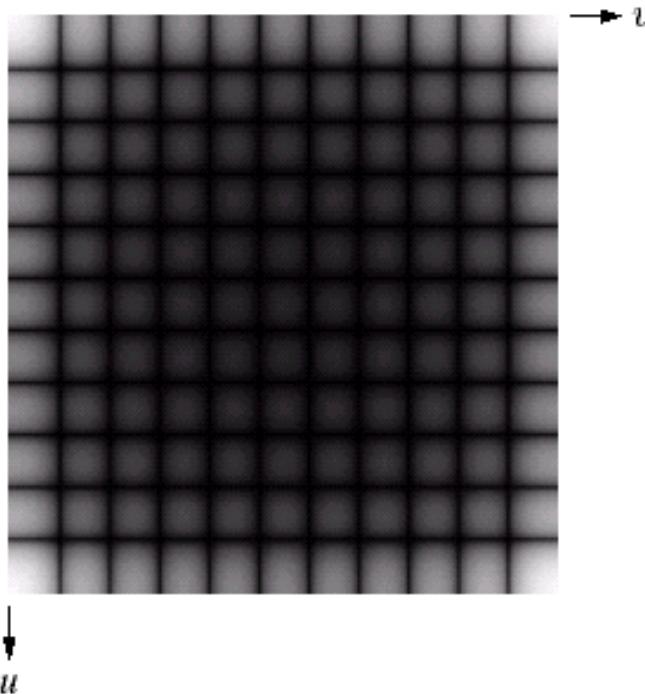

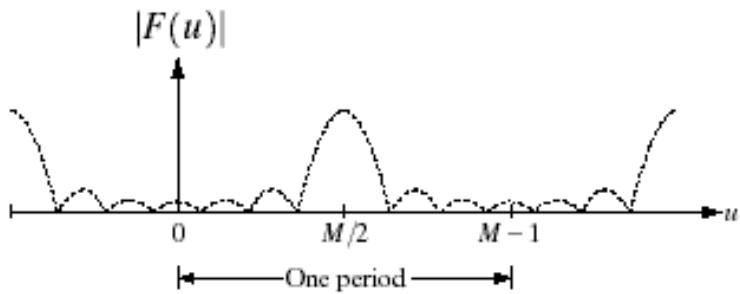

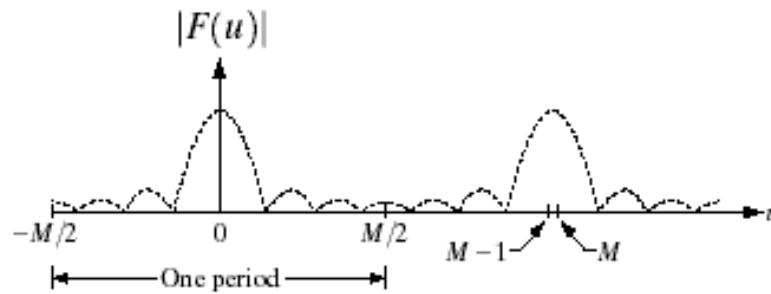

where the magnitude (Fourier spectrum)

$$|F(u, v)| = \sqrt{R^2(u, v) + I^2(u, v)}$$

and

$$\phi(u, v) = \arctan \left[\frac{I(u, v)}{R(u, v)} \right]$$

Periodicity

Frequency Domain Filters & Enhancements

- Lowpass Filter
 - Ideal lowpass filters
 - Butterworth lowpass filters
 - Gaussian lowpass filters
- Highpass Filter
 - Ideal highpass filters
 - Butterworth highpass filters
 - Gaussian highpass filter
 - Laplacian
 - Unsharp masking, highboost filtering, and high-frequency-emphasis filtering
 - Homomorphic filtering
- Selective Filtering
 - Bandreject and bandpass filters
 - Notch filters

Example of Filtering in the Frequency Domain

Basic Steps:

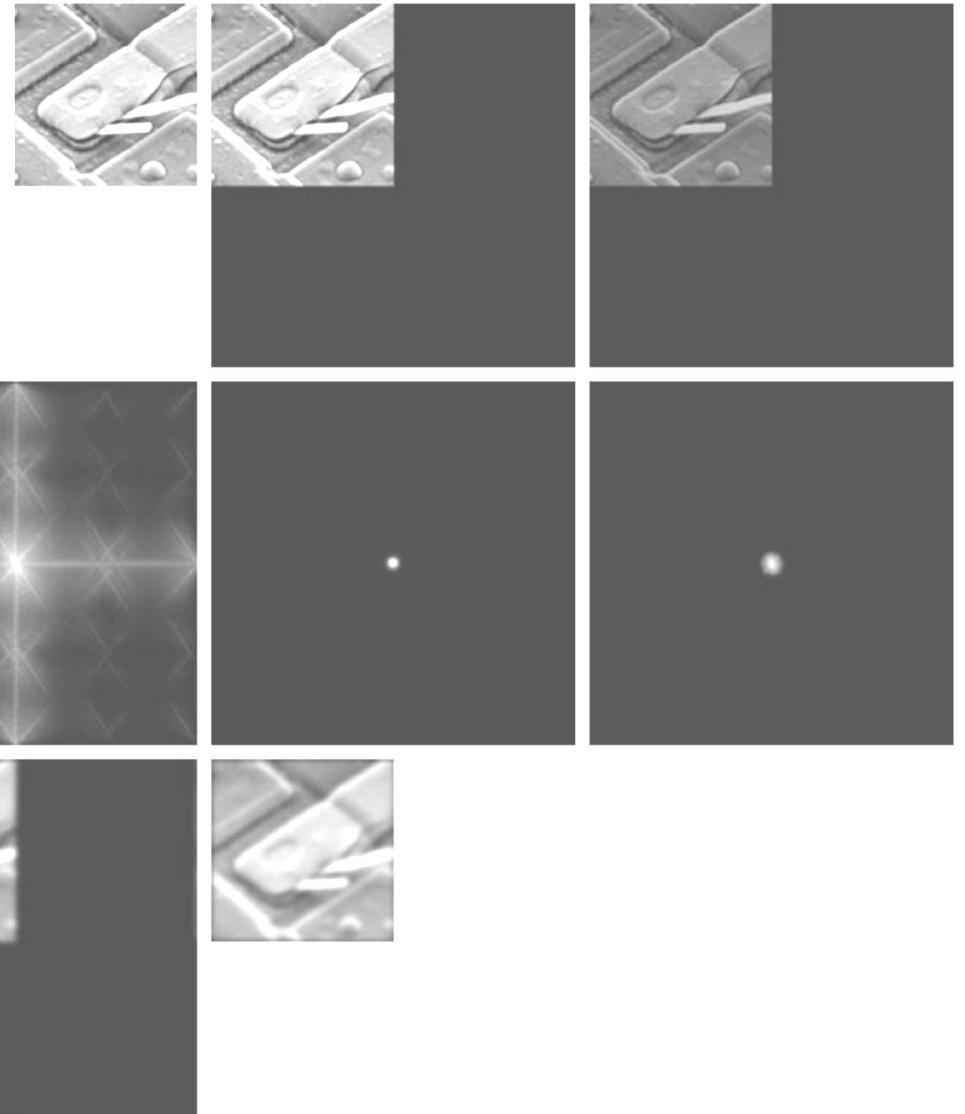

1. Given an input image $f(x, y)$ of size $M \times N$, obtain the padding parameters P and Q ($P = 2M, Q = 2N$).
2. Form a padded image $f_p(x, y)$ of size $P \times Q$.
3. Multiply $f_p(x, y)$ by $(-1)^{x+y}$ to center its transform.
4. Compute the DFT, $F(u, v)$
5. Generate a real, symmetric filter function, $H(u, v)$ of size $P \times Q$ with center at $(P/2, Q/2)$.
6. Form the product

$$G(u, v) = F(u, v)H(u, v)$$

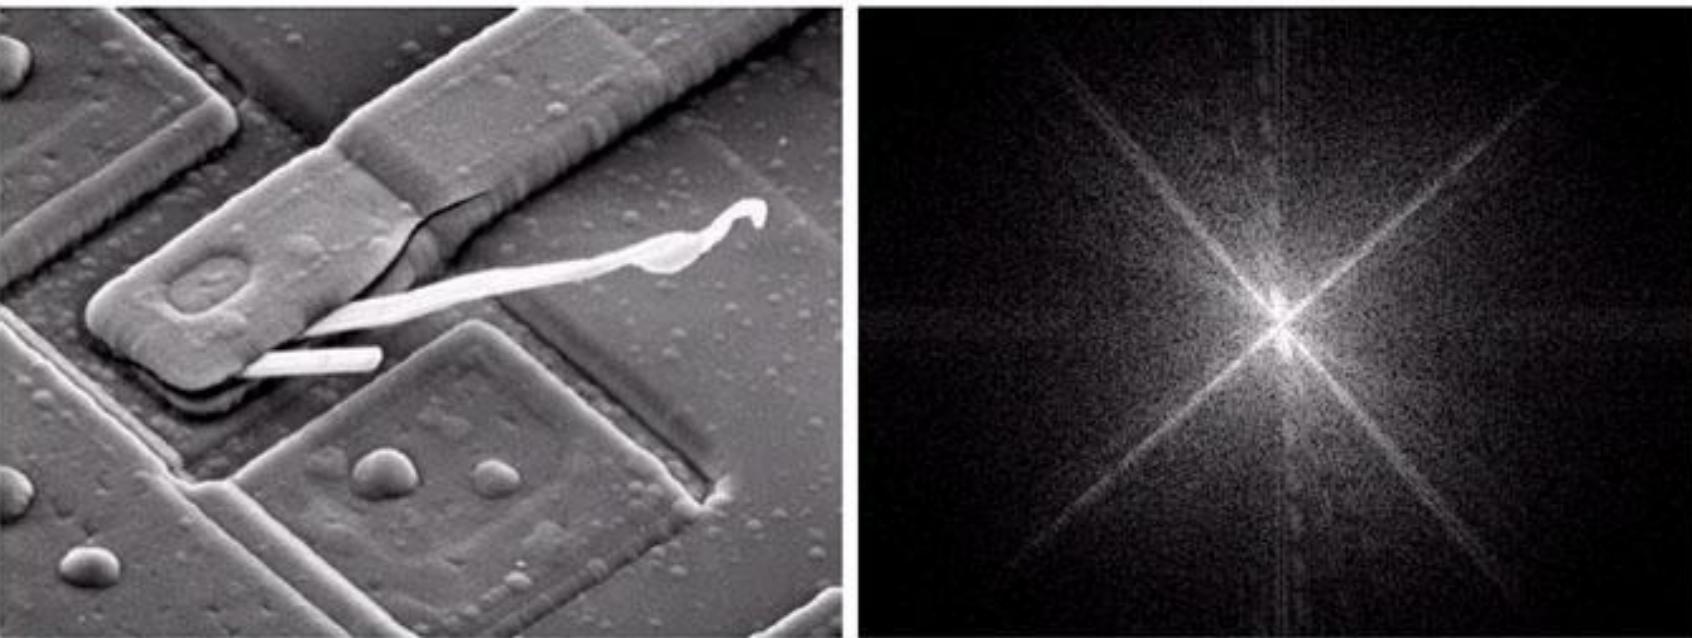

7. Obtain the precessed image

$$g_p(x, y) = \{\text{real}[F^{-1}\{G(u, v)\}]\} (-1)^{x+y}$$

8. Obtain the final processed result, $g(x, y)$, by extracting the $M \times N$ region from the top, left quadrant of $g_p(x, y)$.

Original Image and its FT

To get some sense of what basis elements look like, we plot a basis element --- or rather, its real part --- as a function of x,y for some fixed u, v. We get a function that is constant when $(ux+vy)$ is constant. The magnitude of the vector (u, v) gives a frequency, and its direction gives an orientation. The function is a sinusoid with this frequency along the direction, and constant perpendicular to the direction.

$$\begin{array}{|c|c|} \hline v & \\ \hline & \bullet \quad e^{-j\pi(ux+vy)} \\ \hline u & \\ \hline & e^{j\pi(ux+vy)} \\ \hline \end{array}$$

Lowpass Filters

$$D(u, v) = \left[\left(u - \frac{P}{2} \right)^2 + \left(v - \frac{Q}{2} \right)^2 \right]^{\frac{1}{2}}$$

Ideal lowpass filter

$$H(u, v) = \begin{cases} 1 & , \text{if } D(u, v) \leq D_0 \\ 0 & , \text{if } D(u, v) > D_0 \end{cases}$$

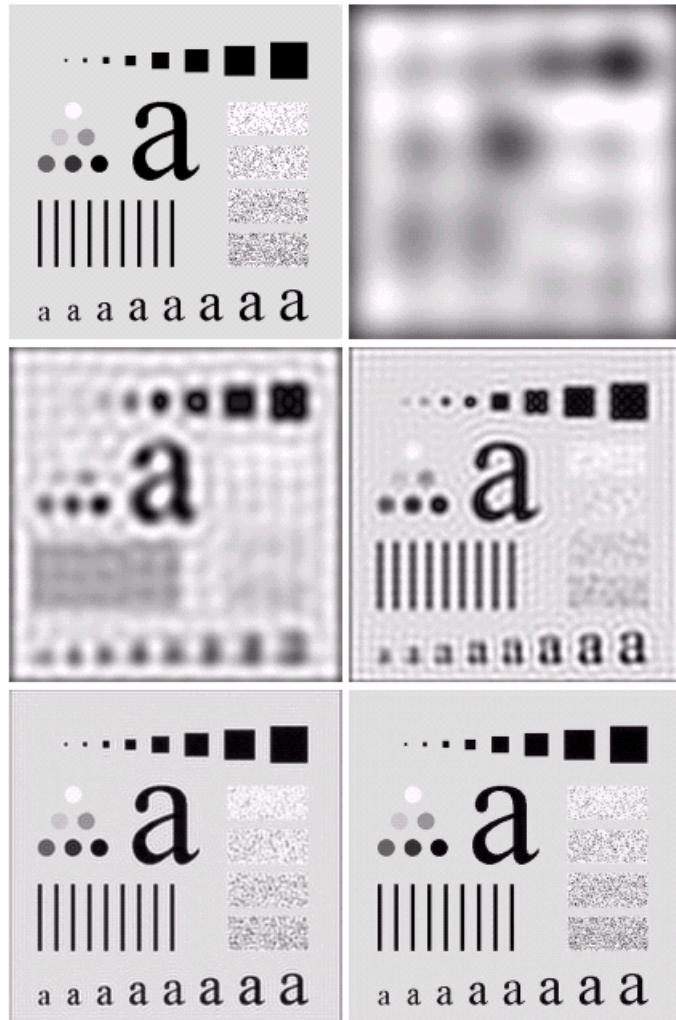

Butterworth lowpass filter

$$H(u, v) = \frac{1}{1 + [D(u, v)/D_0]^{2n}}$$

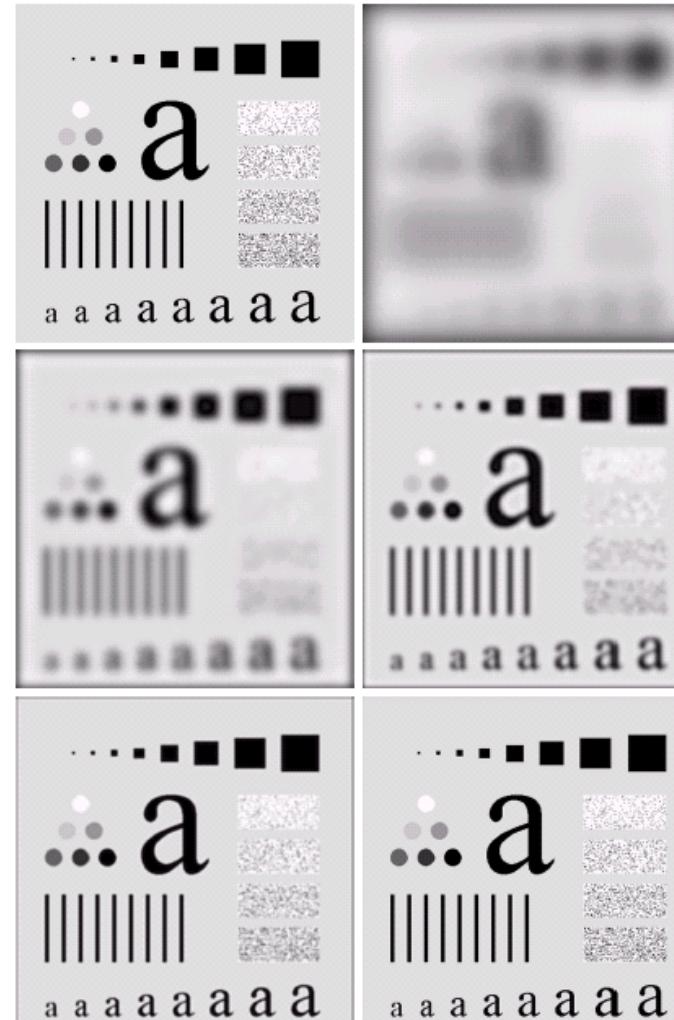

Gaussian lowpass filter

$$H(u, v) = e^{-\frac{D^2(u,v)}{2D_0^2}}$$

Gaussian Lowpass Filters

Historically, certain computer programs were written using only two digits rather than four to define the applicable year. Accordingly, the company's software may recognize a date using "00" as 1900 rather than the year 2000.

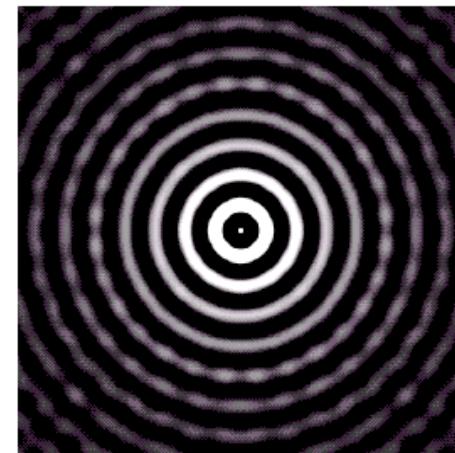

Historically, certain computer programs were written using only two digits rather than four to define the applicable year. Accordingly, the company's software may recognize a date using "00" as 1900 rather than the year 2000.

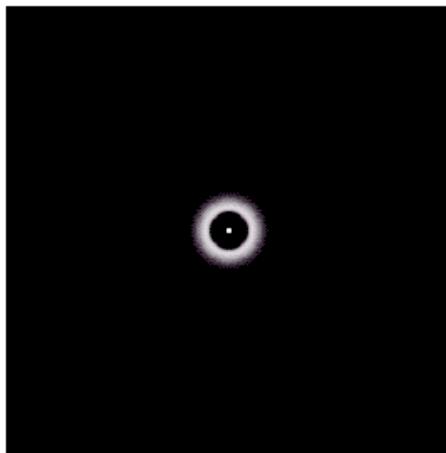

Highpass Filters

$$H_{HP}(u, v) = 1 - H_{LP}(u, v)$$

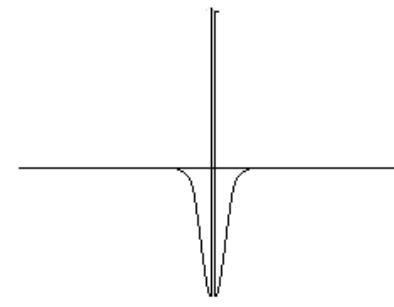

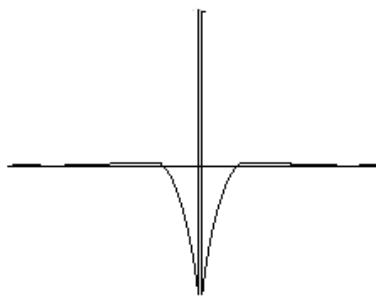

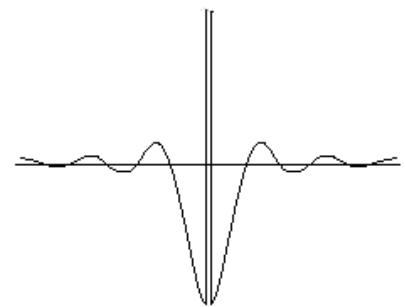

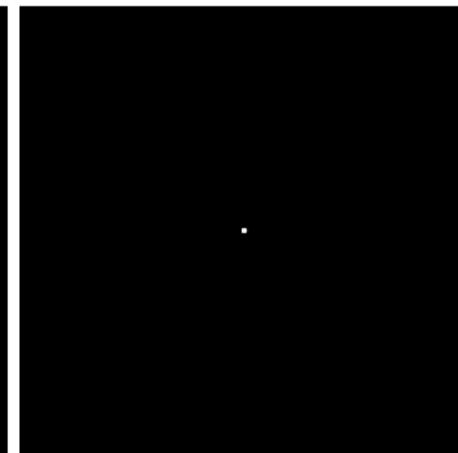

IHPF

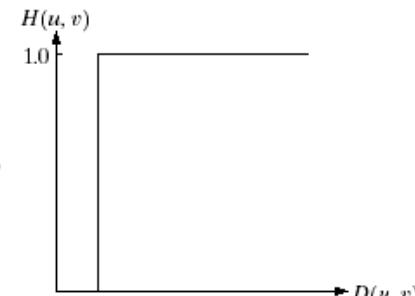

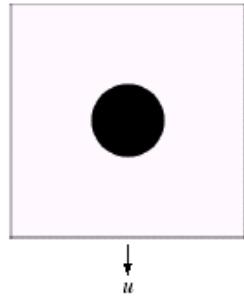

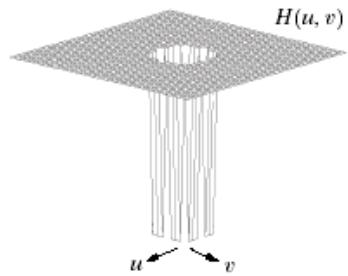

BHPF

GHPF

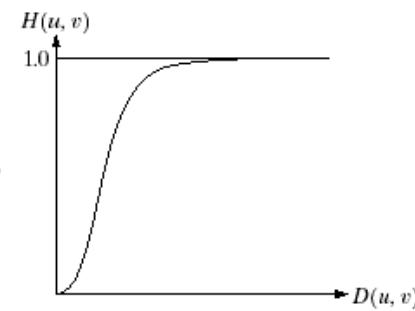

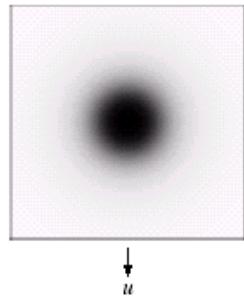

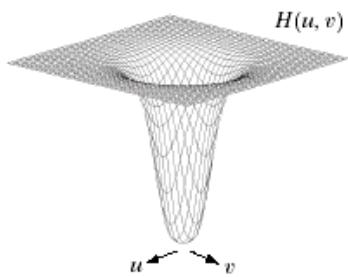

Highpass Filters

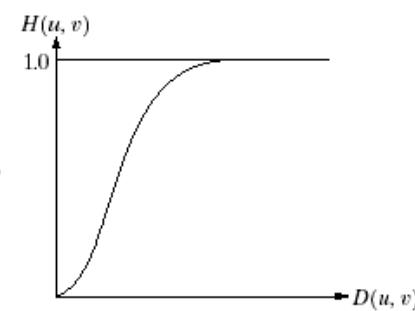

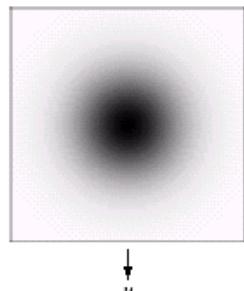

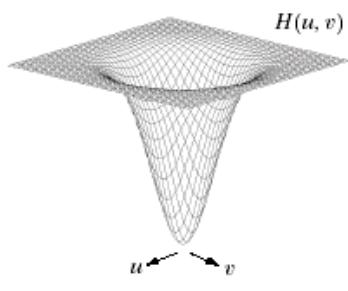

Ideal highpass filter

$$H(u, v) = \begin{cases} 0 & , \text{if } D(u, v) \leq D_0 \\ 1 & , \text{if } D(u, v) > D_0 \end{cases}$$

Butterworth highpass filter

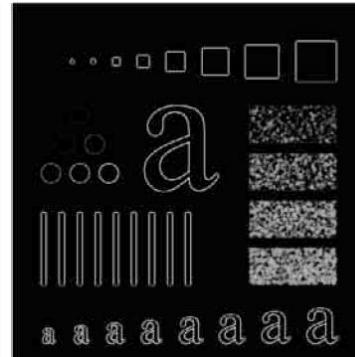

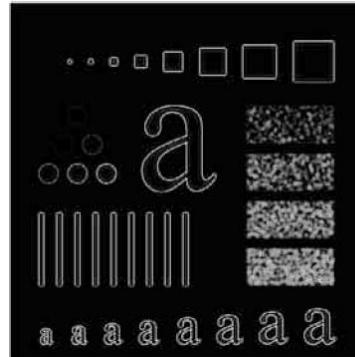

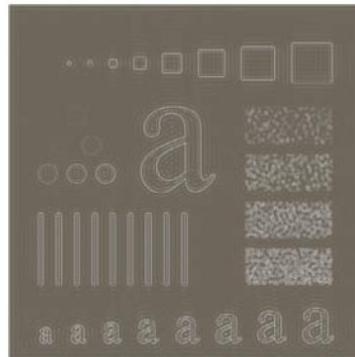

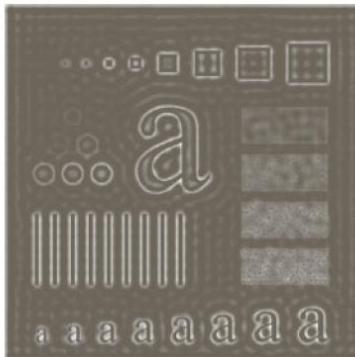

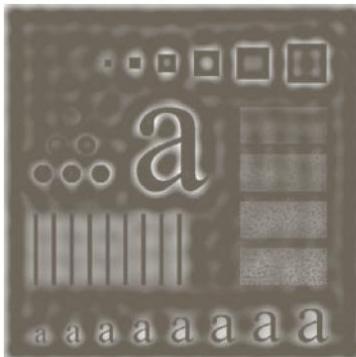

$$H(u, v) = \frac{1}{1 + [D_0/D(u, v)]^{2n}}$$

Gaussian highpass filter

$$H(u, v) = 1 - e^{-\frac{D^2(u, v)}{2D_0^2}}$$

Applications of HPFs

- Ideal HPF
 - $D_o = 30, 60, 160$

- Butterworth HPF
 - $n = 2,$
 - $D_o = 30, 60, 160$

- Gaussian HPF
 - $D_o = 30, 60, 160$

Applications of HPFs

Thumb print

Result of highpass filtering

Result of thresholding

Laplacian HPF

- The Laplacian of a function $f(x, y)$:

$$\nabla^2 f(x, y) = \frac{\partial^2 f(x, y)}{\partial x^2} + \frac{\partial^2 f(x, y)}{\partial y^2}$$

- The Fourier transform of the Laplacian:

$$\begin{aligned}\mathcal{F}\{\nabla^2 f(x, y)\} &= \mathcal{F}\left\{\frac{\partial^2 f(x, y)}{\partial x^2}\right\} + \mathcal{F}\left\{\frac{\partial^2 f(x, y)}{\partial y^2}\right\} \\ &= (j2\pi u)^2 F(u, v) + (j2\pi v)^2 F(u, v) \\ &= -4\pi^2(u^2 + v^2)F(u, v) \\ &= H(u, v)F(u, v)\end{aligned}$$

$$H(u, v) = -4\pi^2 \left[\left(u - \frac{P}{2} \right)^2 + \left(v - \frac{Q}{2} \right)^2 \right] = -4\pi^2 D^2(u, v)$$

Laplacian HPF

- Enhancement is achieved by:

$$g(x, y) = f(x, y) + c \nabla^2 f(x, y)$$

- Because $H(u, v)$ is negative, $c = -1$:

$$\begin{aligned} g(x, y) &= \mathcal{F}^{-1}\{F(u, v) - H(u, v)F(u, v)\} \\ &= \mathcal{F}^{-1}\{[1 + 4\pi^2 D^2(u, v)]F(u, v)\} \end{aligned}$$

Unsharp Masking and Highboost Filtering

$$g_{mask}(x, y) = f(x, y) - f_{LP}(x, y)$$

where a smoothed image is

$$f_{LP}(x, y) = \mathcal{F}^{-1}\{H_{LP}(u, v)F(u, v)\}$$

The filtered image is

$$g(x, y) = f(x, y) + k * g_{mask}(x, y)$$

In the frequency domain:

$$\begin{aligned} g(x, y) &= \mathcal{F}^{-1}\{\left[1 + k * [1 - H_{LP}(u, v)]\right]F(u, v)\} \\ &= \mathcal{F}^{-1}\{\left[1 + k * H_{HP}(u, v)\right]F(u, v)\} \end{aligned}$$

when $k = 1$ is unsharp masking and $k > 1$ is highboost filtering.

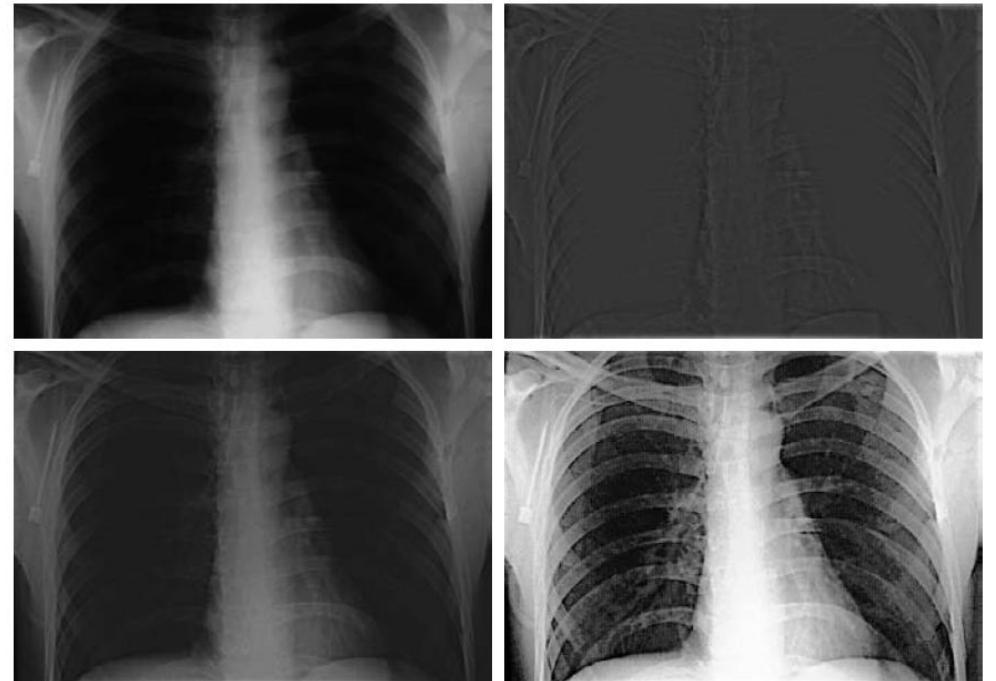

High-Frequency Emphasis Filtering

$$g(x, y) = \mathcal{F}^{-1}\{[k_1 + k_2 * HH_P(u, v)]F(u, v)\}$$

$$H_{HFE}(u, v) = k_1 + k_2 H_{HP}(u, v)$$

where $k_1 \geq 0$ controls of offset from the origin and $k_2 \geq 0$ controls the contribution of high frequencies.

Because highpass filters set dc term to zero which reducing the average intensity in the filtered image

$f(x,y)$

original

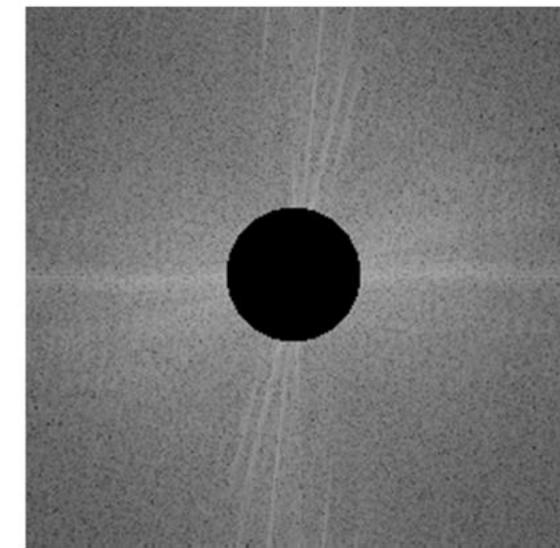

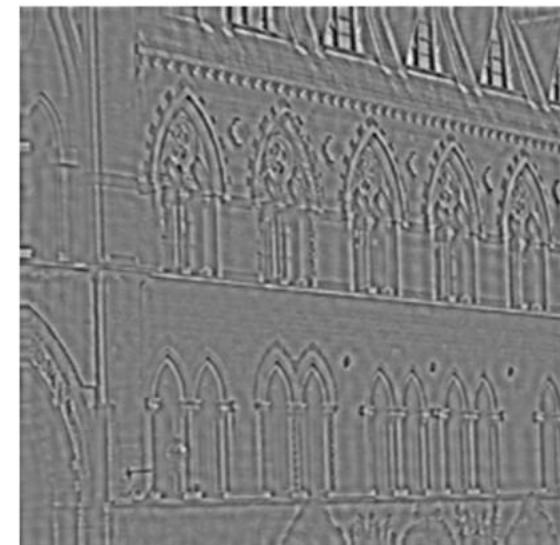

$|F(u,v)|$

low pass

high pass

Homomorphic Filtering

- An image $f(x, y)$ is created by "reflecting" the light from an object that has been “illuminated” by some light source:

$$f(x, y) = i(x, y)r(x, y)$$

- The illuminating intensity $i(x, y)$ is a slowly varying component (controlling overall dynamic range), $r(x, y)$ is a fast varying component (affecting the local contrast).

$$\mathcal{F}\{f(x, y)\} \neq \mathcal{F}\{i(x, y)\} \mathcal{F}\{r(x, y)\}$$

Homomorphic Filtering

$$f(x,y) = i(x,y)r(x,y)$$

$$\ln f(x,y) = \ln i(x,y) + \ln r(x,y)$$

$$Z(u,v)=F_i(u,v)+F_r(u,v)$$

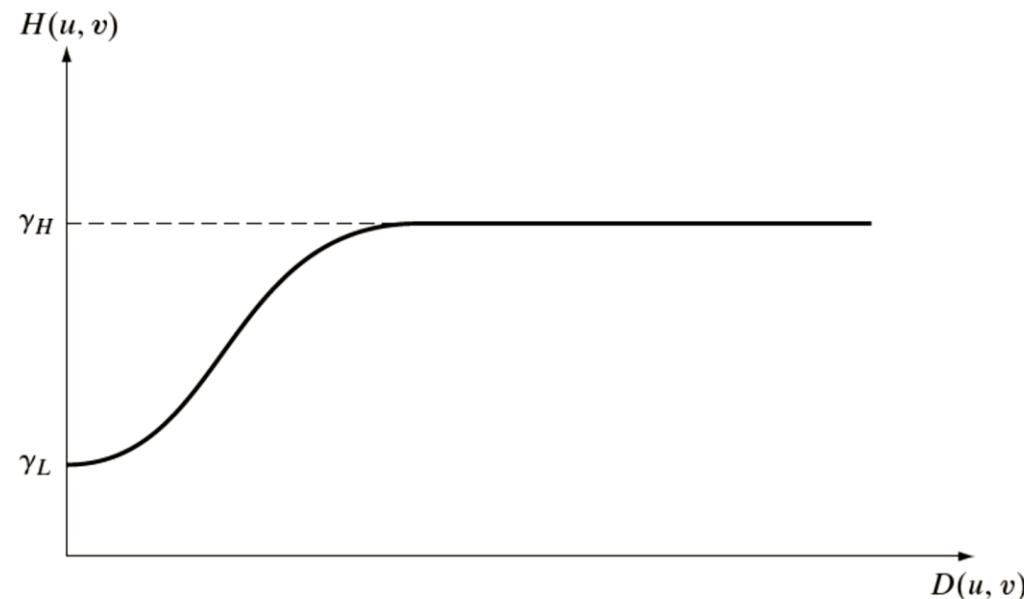

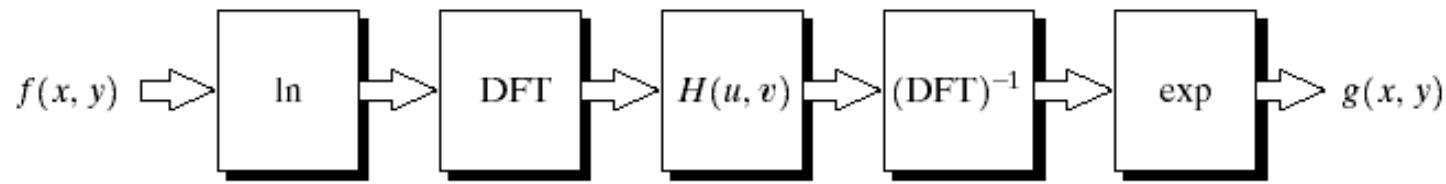

$$S(u,v)=H(u,v)Z(u,v)$$

$$S(u,v)=H(u,v)F_i(u,v)+H(u,v)F_r(u,v)$$

$$s(x,y) = \mathcal{F}^{-1}\{S(u,v)\}$$

$$g(x,y)=e^{s(x,y)}$$

Homomorphic Filtering

$$H(u, v) = (\gamma_H - \gamma_L) \left[1 - e^{-c[D^2(u, v)/D_0^2]} \right] + \gamma_L$$

Homomorphic Filtering

Bandreject and Bandpass Filters

$$H_{BP}(u, v) = 1 - H_{BR}(u, v)$$

Ideal bandreject filter

$$H_{BR}(u, v) = \begin{cases} 0 & , \text{if } D_0 - \frac{W}{2} \leq D \leq D_0 + \frac{W}{2} \\ 1 & , \text{otherwise} \end{cases}$$

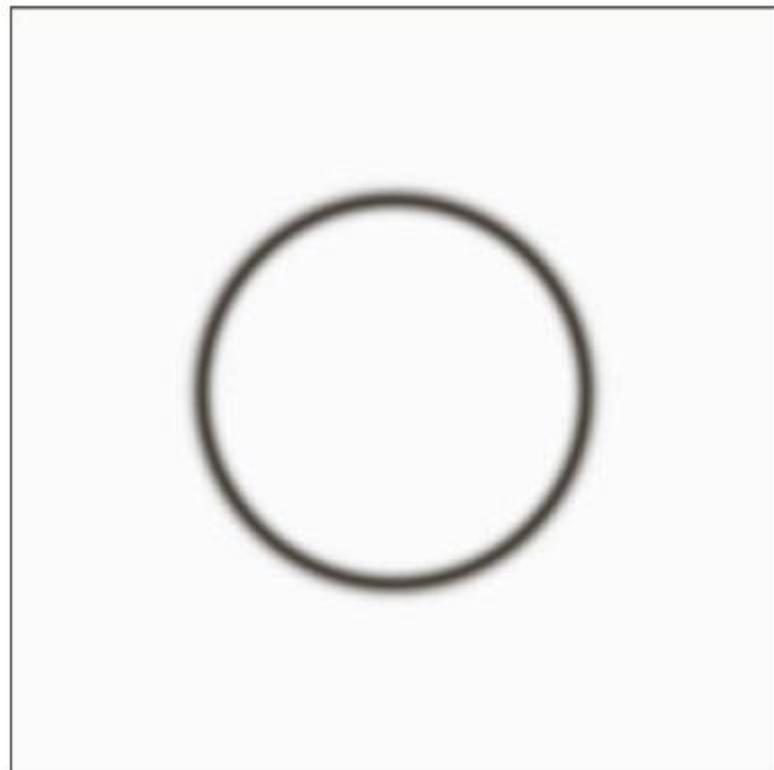

Butterworth bandreject filter

$$H(u, v) = \frac{1}{1 + \left[\frac{DW}{D^2 - D_0^2} \right]^{2n}}$$

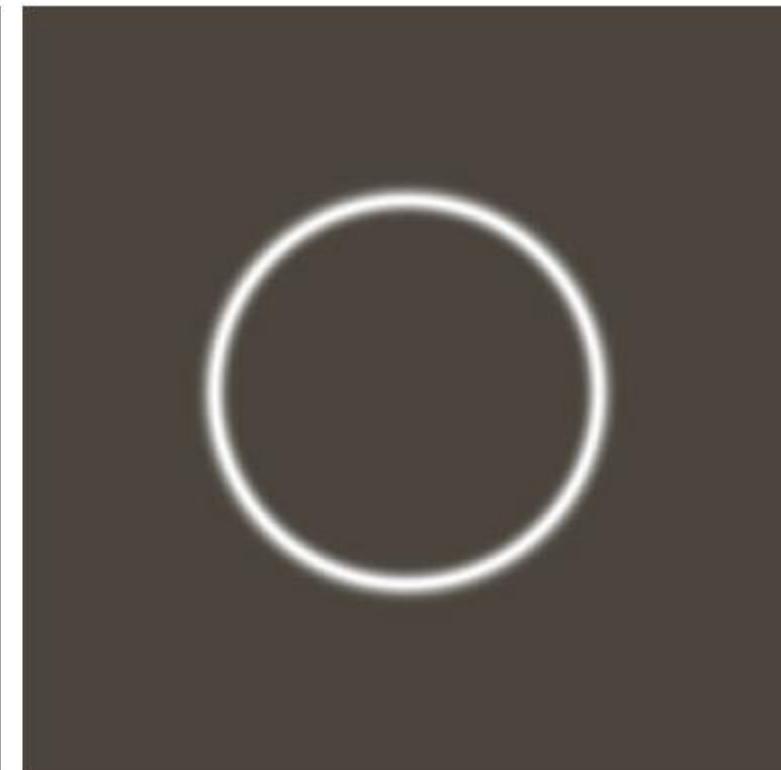

Gaussian bandreject filter

$$H(u, v) = 1 - e^{-\left[\frac{D^2 - D_0^2}{DW} \right]^2}$$

Bandreject and Bandpass Filters

Bandreject Gaussian filter

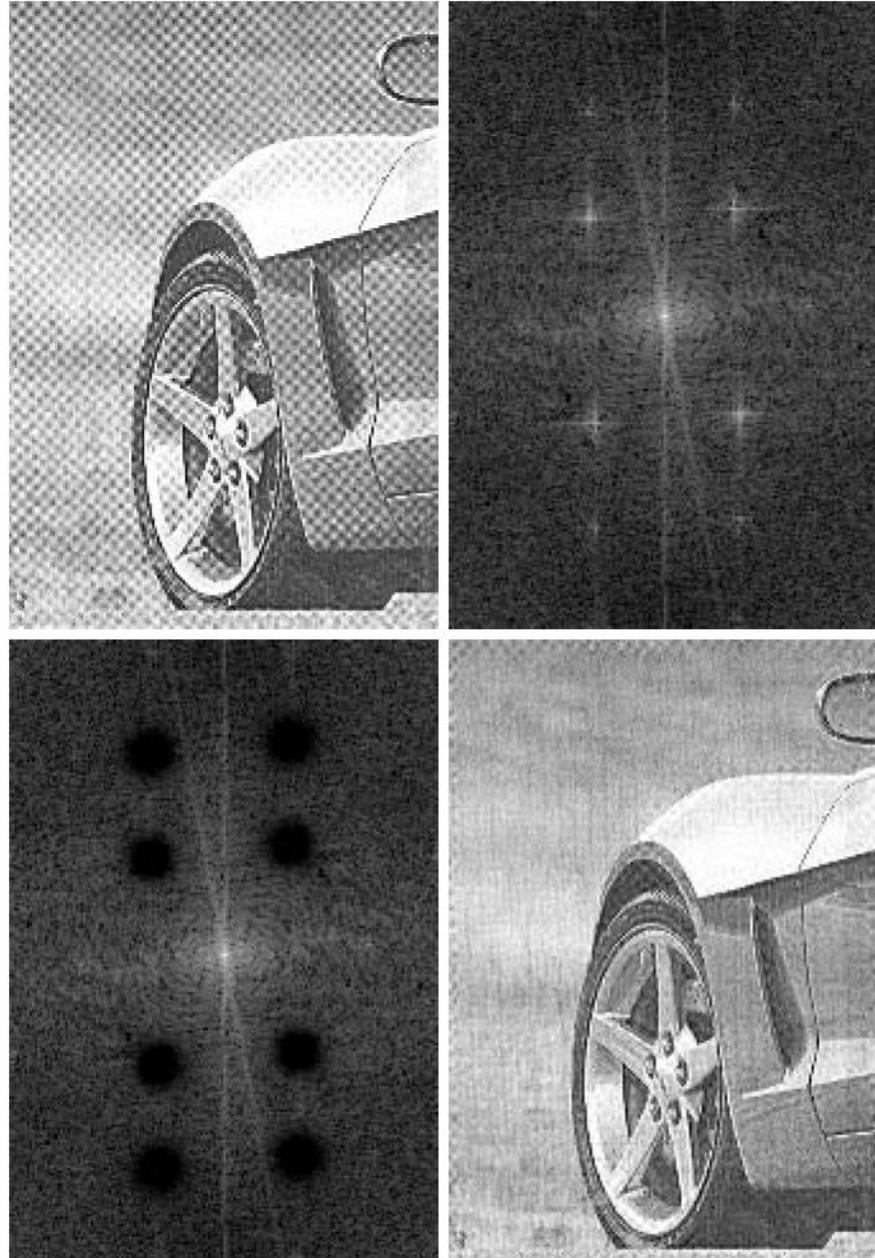

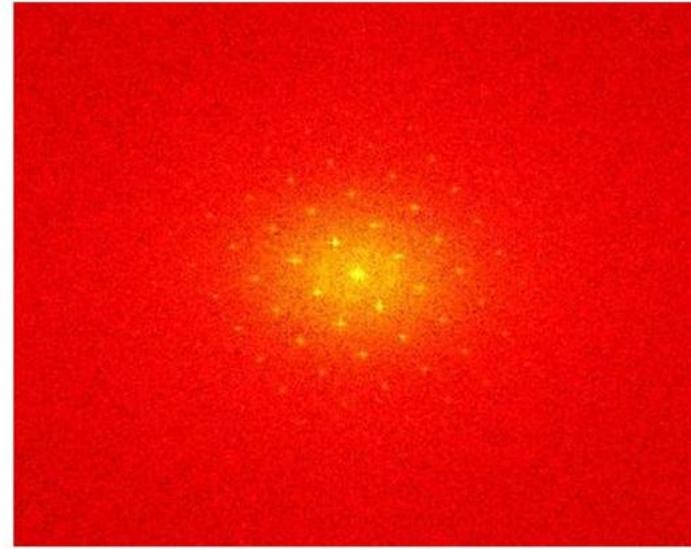

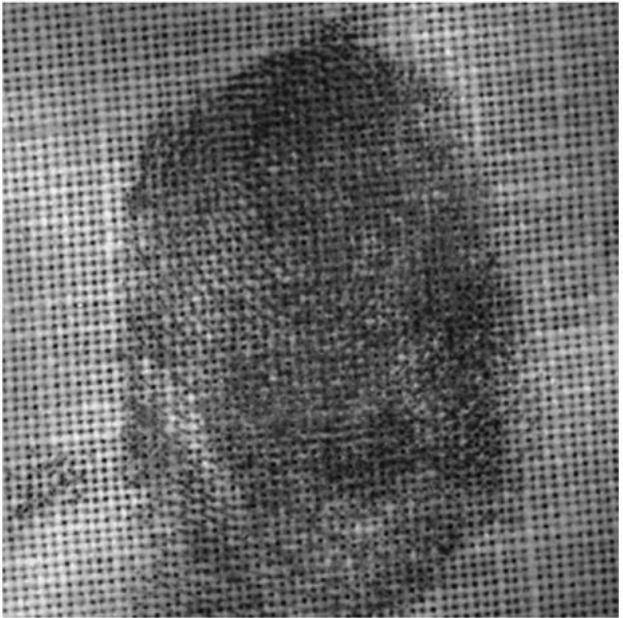

Corresponding Bandpass filter

Notch Filters

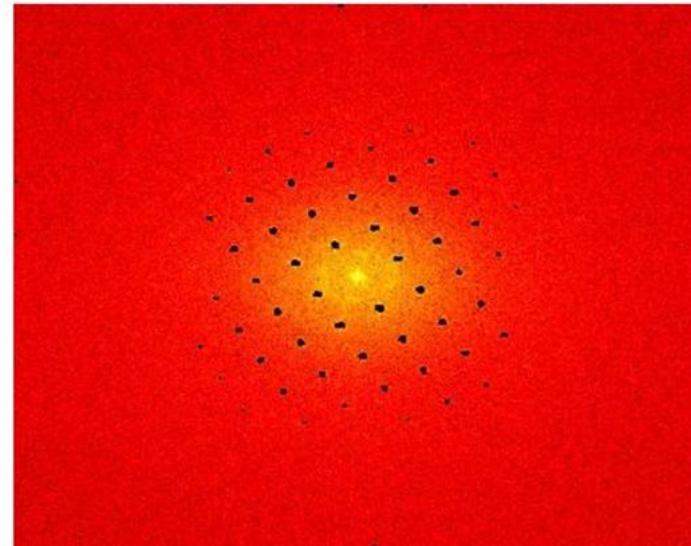

$$H_{NR}(u, v) = \prod_{k=1}^Q H_k(u, v) H_{-k}(u, v)$$

where $H_k(u, v)$ and $H_{-k}(u, v)$ are highpass filters whose centers are at (u_k, v_k) and $(-u_k, -v_k)$, respectively.
